

# CMV-IGG - CYTOMEGALO VIRUS

Profile Details | 1 Parameters

Fasting: Fasting is not mandatory | Report Time: Next Day

**Specimen Required:** Blood

Price- ₹699 **₹395**

## Parameters Included

### About This Test

A CMV IgG test measures the presence of IgG antibodies against cytomegalovirus (CMV) in the blood. IgG antibodies indicate a past infection and provide long-term immunity against CMV. This test helps determine whether a person has been previously exposed to CMV, which is important for pregnant women, organ transplant recipients, and immunocompromised individuals. A positive CMV IgG result suggests prior exposure and potential immunity, while a negative result indicates no previous infection and susceptibility to CMV.
