About This Test

An evening cortisol test measures the level of cortisol, a hormone produced by the adrenal glands, in the blood or saliva during the evening. Cortisol follows a natural diurnal rhythm, typically peaking in the morning and declining throughout the day. Measuring evening cortisol levels is crucial for diagnosing disorders related to cortisol production, such as Cushing's syndrome, where cortisol levels remain abnormally high throughout the day, or Addison's disease, where cortisol levels may be inappropriately low. Abnormal evening cortisol levels can also indicate issues with the hypothalamic-pituitary-adrenal (HPA) axis. This test helps assess adrenal function and diagnose conditions related to cortisol dysregulation.
