About This Test

A cortisol morning test measures the level of cortisol, a hormone produced by the adrenal glands, in the blood. Cortisol levels naturally peak in the early morning and decrease throughout the day. This test is typically performed in the morning to evaluate adrenal gland function and diagnose conditions such as Cushing's syndrome (high cortisol) or Addison's disease (low cortisol). By assessing morning cortisol levels, healthcare providers can better understand the body's stress response and hormonal balance.
