CPK MB- MASS

Profile Details | 1 Parameters

Fasting: Overnight fasting for 9-12 hours | Report Time: Same day

Specimen Required: Blood

Price- ~~₹999~~ **₹399**

Parameters Included

About This Test

Creatine kinase-MB (CK-MB) mass is an enzyme primarily found in the heart muscle (myocardium). It is a specific form of creatine kinase that plays a crucial role in diagnosing acute myocardial infarction (heart attack). CK-MB levels rise significantly within 4-6 hours after the onset of myocardial injury and peak around 12-24 hours, making it a valuable marker for early detection of cardiac damage. CK-MB mass is measured through a blood test and is used alongside other cardiac biomarkers, such as troponin, to confirm or rule out a heart attack. Elevated levels of CK-MB mass indicate myocardial damage, guiding timely interventions and treatment decisions to minimize cardiac tissue injury and improve patient outcomes.

98% On-Time Reports	**100% Sample Accuracy**	**Free Home Collection**	**Expert Doctors**	**750+ Lab Tests**
Available 24×7	NABL Certified Labs	Door-to-Door Pickup	Across India	Trusted & Reliable

**Fasting 10–12 hrs essential | *Limited Period Offer | *Reports within Same day*
