

DES- GAMMA CARBOXY PROTHROMBIN (DCP) / PIVKA II ,SERUM

Profile Details | 1 Parameters

Fasting: Fasting is not mandatory | Report Time: Within 4 Days

Specimen Required: Blood

Price- ₹4900 **₹3580**

Parameters Included

About This Test

Des-gamma-carboxy prothrombin (DCP), also known as PIVKA-II (Protein Induced by Vitamin K Absence or Antagonist-II), is an abnormal form of prothrombin produced by the liver. It is typically measured to assess and monitor certain liver conditions, especially hepatocellular carcinoma (HCC), a primary liver cancer. - **DCP/PIVKA-II**:
Elevated levels of DCP/PIVKA-II in the blood are associated with HCC and can indicate the presence of liver tumors. The test is valuable in diagnosing liver cancer, monitoring treatment efficacy, and detecting cancer recurrence. By measuring DCP/PIVKA-II levels, healthcare providers can differentiate between malignant and benign liver conditions, aiding in accurate diagnosis and effective management of liver diseases. Accurate measurement of DCP/PIVKA-II is crucial for early detection and treatment of hepatocellular carcinoma, improving patient outcomes and survival rates.
