About This Test

Haptoglobin measures the level of a protein in the blood that binds free hemoglobin released from damaged red blood cells. This binding helps prevent hemoglobin loss and protects the kidneys from damage. Low haptoglobin levels can indicate conditions such as hemolytic anemia, where red blood cells are destroyed prematurely, or other disorders causing excessive red cell breakdown. Elevated levels may be seen in response to inflammation, infection, or tissue damage. The test aids in diagnosing and monitoring these conditions.
