About This Test

The HAV IgG ELISA (Enzyme-Linked Immunosorbent Assay) test measures the presence of immunoglobulin G (IgG) antibodies specific to the Hepatitis A virus (HAV) in the blood. This test is used to determine if a person has been exposed to HAV in the past, indicating either a past infection or successful vaccination. - **IgG Antibodies**: These indicate past infection or vaccination, as they develop after the initial infection and remain in the body long-term. The HAV IgG ELISA test is useful for confirming immunity status, diagnosing past HAV infections, and distinguishing between current and previous infections. It helps in assessing long-term protection and guiding vaccination decisions. Accurate measurement of HAV IgG provides essential information about an individual's exposure history and immunity to Hepatitis A.
