

HBSAG - HEPATITIS B SURFACE ANTIGEN CLIA METHOD

Profile Details | 1 Parameters

Fasting: Fasting not mandatory | Report Time: Same day

Specimen Required: Blood

Price- ₹799 ₹449

Parameters Included

About This Test

The HBsAg (Hepatitis B surface antigen) test using the CLIA (Chemiluminescent Immunoassay) method detects the presence of HBsAg in blood samples. CLIA is a highly sensitive and specific laboratory technique that utilizes chemiluminescence to measure the amount of HBsAg present in the sample. During the test, HBsAg in the sample binds to specific antibodies coated with a chemiluminescent molecule. This binding produces light, which is measured and quantified by a luminometer. The intensity of the light emitted correlates with the concentration of HBsAg in the sample, providing accurate and quantitative results. The CLIA method is widely used in clinical laboratories due to its reliability in detecting low levels of HBsAg and its ability to distinguish between positive and negative results efficiently.
