About This Test

The Helicobacter pylori (H. pylori) antigen stool test detects the presence of H. pylori antigens in a stool sample. H. pylori is a type of bacteria that can infect the stomach lining and is a common cause of peptic ulcers, chronic gastritis, and can contribute to the development of stomach cancer. ****Test Purpose:**** - ****Detection of Infection:**** Identifies current H. pylori infection by detecting bacterial antigens in the stool. - ****Monitoring Treatment:**** Evaluates the effectiveness of treatment for H. pylori infection as the absence of antigens post-treatment indicates successful eradication of the bacteria. ****Test Interpretation:**** - ****Positive Result:**** Indicates an active H. pylori infection. - ****Negative Result:**** Suggests the absence of an active infection, although it does not rule out a past infection that has been cleared. This non-invasive test is commonly used due to its simplicity and accuracy, helping in diagnosing H. pylori-related gastrointestinal conditions and monitoring treatment outcomes.
