Profile Details | 1 Parameters

Fasting: Overnight fasting for 9-12 hours | Report Time: Next Day

**Specimen Required:** Stool

**Price-** ₹2500 **₹1999**

## Parameters Included

### About This Test

The Helicobacter pylori (H. pylori) antigen stool test detects the presence of H. pylori antigens in a stool sample. H. pylori is a type of bacteria that can infect the stomach lining and is a common cause of peptic ulcers, chronic gastritis, and can contribute to the development of stomach cancer. **\*\*Test Purpose:\*\*** - **\*\*Detection of Infection:\*\*** Identifies current H. pylori infection by detecting bacterial antigens in the stool. - **\*\*Monitoring Treatment:\*\*** Evaluates the effectiveness of treatment for H. pylori infection as the absence of antigens post-treatment indicates successful eradication of the bacteria. **\*\*Test Interpretation:\*\*** - **\*\*Positive Result:\*\*** Indicates an active H. pylori infection. - **\*\*Negative Result:\*\*** Suggests the absence of an active infection, although it does not rule out a past infection that has been cleared. This non-invasive test is commonly used due to its simplicity and accuracy, helping in diagnosing H. pylori-related gastrointestinal conditions and monitoring treatment outcomes.
