About This Test

The HBeAg (Hepatitis B e-antigen) test measures the presence of the e-antigen from the hepatitis B virus (HBV in the blood. HBeAg indicates active viral replication and high infectivity, suggesting a more severe or acute stage of hepatitis B. A positive HBeAg result generally means the virus is actively reproducing and the patient is highly contagious. Monitoring HBeAg levels helps assess the progression of hepatitis B, evaluate the effectiveness of treatment, and guide management decisions.
