About This Test

The Hepatitis C Virus (HCV) Total Antibody by ELISA (Enzyme-Linked Immunosorbent Assay) test measures the presence of antibodies against the hepatitis C virus in the blood. This test indicates whether a person has been exposed to HCV, regardless of whether the infection is current or has occurred in the past. A positive result suggests that the individual has been infected with HCV at some point, necessitating further testing to determine the current infection status and appropriate medical management
