About This Test

The HEV IgM test measures the presence of Immunoglobulin M (IgM) antibodies against the Hepatitis E virus (HEV) in the blood. This test is used to diagnose a recent or acute Hepatitis E infection. IgM antibodies are typically the first antibodies produced by the immune system in response to an infection, indicating a recent or ongoing infection with HEV. The presence of HEV IgM helps confirm a Hepatitis E infection and can aid in distinguishing it from other types of hepatitis.
