HEV IGG - HEPATITIS E VIRUS IGG ANTIBODIES QUALITATIVE

Profile Details | 1 Parameters

Fasting: Fasting is not mandatory | Report Time: Within 3 Days

Specimen Required: Blood

Price- ~~₹1500~~ **₹860**

Parameters Included

About This Test

A **HEV (Hepatitis E Virus) antibody IgG** test measures the presence of IgG antibodies against the Hepatitis E virus in the blood. Here's what the test assesses: 1. **Past Infection**: IgG antibodies typically indicate a past infection with Hepatitis E, as these antibodies develop after exposure to the virus and remain in the body long-term, providing immunity against future infections. 2. **Immune Status**: The test helps determine if an individual has been previously infected with Hepatitis E and has developed immunity against the virus. 3. **Epidemiological Studies**: It can be used in population studies to understand the prevalence of past Hepatitis E infections in a specific area or population group. 4. **Diagnosis**: While IgG antibodies indicate past infection, they can also be present during the later stages of an acute infection, alon with IgM antibodies, which appear earlier. In summary, the HEV antibody IgG test measures the level of IgG antibodies to determine past infection and immunity to Hepatitis E.
