Profile Details | 1 Parameters

Fasting: Fasting is not mandatory | Report Time: Same Day

Specimen Required: Blood

Price- ₹640 **₹380**

Parameters Included

About This Test

An HIV rapid test measures the presence of antibodies to the human immunodeficiency virus (HIV) or HIV antigens in the blood, saliva, or urine. This test is designed to quickly screen for HIV infection and provide results within minutes. There are two main types of rapid tests: 1. **Antibody Tests:** Detect antibodies produced by the immune system in response to HIV infection. 2. **Antigen/Antibody Tests:** Detect both HIV antibodies and the HIV p24 antigen, which is a protein associated with the virus. Rapid HIV tests are used for early detection of HIV infection, often in clinical settings, community health programs, or at home. Positive results from a rapid test typically require confirmation with more comprehensive tests, such as a nucleic acid test (NAT) or an enzyme immunoassay (EIA), to ensure accurate diagnosis.
