About This Test

HSV-1 IgG antibodies measure the presence of immunoglobulin G (IgG) antibodies specific to the herpes simplex virus type 1 (HSV-1) in the blood. These antibodies indicate a past or current infection with HSV-1, which commonly causes oral herpes. A positive IgG result suggests that a person has been exposed to HSV-1 at some poin even if they are not currently experiencing symptoms. This test helps in diagnosing previous HSV-1 infections and understanding immune response.
