About This Test

HSV-2 IgG antibodies measure the presence of immunoglobulin G (IgG) antibodies specific to the herpes simplex virus type 2 (HSV-2) in the blood. These antibodies indicate a past or current infection with HSV-2, which commonly causes genital herpes. A positive IgG result suggests that a person has been exposed to HSV-2 at some point, even if they are not currently experiencing symptoms. This test helps in diagnosing previous HSV-2 infections, understanding immune response, and differentiating between HSV-1 and HSV-2 infections.
