About This Test

Immunoglobulin IgM is a blood test that measures the level of immunoglobulin M (IgM) antibodies, which are produced by the immune system in response to infection or foreign substances. IgM is the first type of antibody produced when the body encounters a new pathogen or antigen. ****Key Points:**** - ****Early Response:**** IgM antibodies are the earliest antibodies produced in response to an infection and indicate a recent or acute infection. - ****Diagnosis:**** Elevated levels of IgM can indicate recent infections with various pathogens, such as viruses or bacteria. - ****Assessment:**** The test helps diagnose and monitor infections and assess immune system function. IgM levels are useful for diagnosing recent or ongoing infections, distinguishing between acute and chronic stages of an illness, and evaluating the immune response to infections or vaccines.
