About This Test

Inhibin A is a protein produced by the ovaries (in females) or the testes (in males) and plays a role in regulating the reproductive hormones. The **Inhibin A** test measures the level of this protein in the blood. Here's what the test assesses: 1. **Ovarian Function**: In females, inhibin A is produced by the ovaries and helps regulate the menstrual cycle and follicle development. Elevated or decreased levels can provide information about ovarian function and health. 2. **Assessment of Fertility**: Used in fertility evaluations to assess ovarian reserve (the number and quality of eggs remaining in the ovaries) and function. 3. **Monitoring Pregnancy**: In pregnant women, inhibin A levels are part of the quad screen (a prenatal test) to assess the risk of certain conditions, including Down syndrome (trisomy 21) and other chromosomal abnormalities. 4. **Diagnosis of Tumors**: Inhibin A levels can also be elevated in certain tumors, such as ovarian sex-cord stromal tumors or testicular tumors, helping in diagnosis and monitoring. In summary, the inhibin A test measures the level of this protein to evaluate ovarian or testicular function, assist in fertility assessments, monitor pregnancy, and aid in diagnosing certain tumors.
