About This Test

A milk allergy test measures the body's immune response to proteins found in milk, typically through specific IgE antibody testing or skin prick testing. **Key Points:** - **Specific IgE Testing:** Measures the level of IgE antibodies in the blood specific to milk proteins, such as casein and whey. Elevated IgE levels indicate an allergic reaction to milk. - **Skin Prick Test:** Involves exposing the skin to milk proteins to see if an allergic reaction occurs, such as redness or swelling. - **Clinical Relevance:** Helps diagnose milk allergy, distinguish it from lactose intolerance (which is not an immune response), and guide dietary modifications to avoid allergic reactions. These tests are crucial for identifying milk allergies, managing symptoms, and preventing adverse reactions.
