About This Test

The PLGF (Placental Growth Factor) test is a blood test used during pregnancy to assess the health of the placenta and help identify women at risk of preeclampsia, a condition characterized by high blood pressure and potential organ damage. Low PLGF levels may indicate poor placental function and an increased risk of pregnancy complications. The test is commonly performed between 20 and 36 weeks of pregnancy, especially in women with symptoms or risk factors for preeclampsia. PLGF results are interpreted alongside clinical findings and other tests to guide diagnosis, monitoring, and timely management, helping improve outcomes for both mother and baby.
