Profile Details | 1 Parameters

Fasting: Overnight fasting for 9-12 hours | Report Time: Same day

Specimen Required: Blood

Price- ₹599 ₹499

## **Parameters Included**

## **About This Test**

Prolactin is a hormone produced by the pituitary gland, located at the base of the brain. It plays a crucial role in reproductive and metabolic processes: - \*\*Women\*\*:

Prolactin stimulates breast milk production (lactation) after childbirth. Elevated levels outside of pregnancy and breastfeeding can cause galactorrhea (unexpected milk production) and menstrual irregularities. - \*\*Men\*\*: Prolactin influences reproductive health, and high levels can lead to decreased libido, erectile dysfunction, and infertility due to its effect on testosterone production. A prolactin test measures the hormone's level in the blood to diagnose and monitor conditions related to the pituita gland, such as prolactinoma (a benign tumor), and other endocrine disorders, ensuring appropriate treatment and management.
