About This Test

The scrub typhus IgM antibodies test measures the presence of immunoglobulin M (IgM) antibodies against the *Orientia tsutsugamushi* bacterium, which causes scrub typhus. This test is used to diagnose scrub typhus, an infectious disease transmitted by chiggers (larval mites) and characterized by symptoms like fever, rash, and eschar (a necrotic lesion at the site of the bite). IgM antibodies are typically produced early in the course of infection, so their presence indicates a recent or acute infection. A positive result confirms exposure to *Orientia tsutsugamushi* and helps differentiate scrub typhus from other febrile illnesses with similar symptoms. The test is crucial for accurate diagnosis and timely treatment to prevent complications associated with scrub typhus.
