About This Test

Serum protein electrophoresis measures the levels and types of proteins in the blood by separating them based on their electrical charge and size. This test identifies and quantifies different protein fractions, including albumin and globulins (alpha-1, alpha-2, beta, and gamma globulins). It helps diagnose and monitor conditions such as multiple myeloma, liver disease, kidney disorders, and inflammatory or autoimmune diseases. Abnormal patterns can indicate specific health issues and guide further diagnostic evaluation.
