About This Test

The **Typhi Dot IgM** test is used to detect the presence of immunoglobulin M (IgM) antibodies against *Salmonella typhi*, the bacterium responsible for typhoid fever. IgM antibodies typically appear early in the course of an infection, indicating a recent or acute infection with *Salmonella typhi*. This test is valuable for diagnosing typhoi fever, particularly in the context of symptoms such as prolonged fever, abdominal pain, and gastrointestinal issues. It helps distinguish typhoid fever from other febrile illnesses. The Typhi Dot IgM test is often used alongside other diagnostic methods to confirm the presence of the infection and guide appropriate treatment.
