About This Test

The Typhi Dot IgM test measures the presence of IgM antibodies specific to *Salmonella typhi*, the bacterium that causes typhoid fever. Elevated IgM levels typically indicate a recent or acute infection with *S. typhi*. This test helps diagnose typhoid fever, especially in the early stages of the disease, as IgM antibodies appear shortly after infection and are a marker of the body's initial response to the pathogen. The presence of IgM antibodies suggests that the infection is recent or ongoing.
