About This Test

Unconjugated estriol (uE3) is measured in maternal blood during pregnancy to assess fetal health and development. It is a form of estrogen produced by the placenta and fetal liver. Low levels of uE3 can indicate potential chromosomal abnormalities such as Down syndrome or Edwards syndrome, as well as fetal adrenal gland or liver issues. The test is often part of the second-trimester maternal serum screening (quad screen) to evaluate the risk of certain genetic conditions and developmental problems.
