About This Test

The urine protein-creatinine ratio (UPCR) measures the amount of protein in the urine relative to the amount of creatinine. This test is used to assess kidney function and detect kidney damage. Elevated UPCR levels indicate increased protein in the urine, a sign of kidney disease or damage, which can result from conditions like diabetes, hypertension, or glomerulonephritis. The UPCR provides a convenient and accurate assessment of proteinuria, helping guide diagnosis and treatment decisions for kidney related conditions.
