URINE PROTEIN ELECTROPHORESIS

Profile Details | 1 Parameters

Fasting: Overnight fasting for 9-12 hours \mid Report Time: Within 5 Days

Specimen Required: Urine

Price- ₹1800 **₹890**

Parameters Included

About This Test

Urine protein electrophoresis is a laboratory test that measures and identifies the different types of proteins present in urine. This test helps detect and evaluate abnormalities in protein levels, which can indicate various kidney and systemic diseases. During the test, a urine sample is subjected to an electric field, causing proteins separate based on their size and charge. The resulting pattern of protein bands is then analyzed to identify the presence of specific proteins, such as albumin, immunoglobulins, and Bence Jones proteins. Urine protein electrophoresis is particularly useful in diagnosing and monitoring conditions like multiple myeloma, amyloidosi and other plasma cell disorders. It can also help assess kidney function and detect proteinuria, which is a sign of kidney damage or disease. By identifying abnormal protein patterns, this test provides valuable information for diagnosis, prognosis, and treatment planning.
