About This Test

The VDRL (Venereal Disease Research Laboratory) titer measures the concentration of antibodies in the blood that are produced in response to syphilis, a sexually transmitted infection caused by the bacterium *Treponema pallidum*. This non-treponemal test detects the presence of reagin antibodies, which are not specific to syphil but can indicate its presence. A VDRL titer helps determine the level of these antibodies, aiding in diagnosing syphilis and monitoring the effectiveness of treatment.
